

UTM
UNIVERSITI TEKNOLOGI MALAYSIA

FACULTY OF COMPUTING
SEMESTER 1 2024/2025

SECR 1213 NETWORK COMMUNICATIONS
SECTION 02
PROJECT TASK 6B
LECTURER: ASSOC. PROF. TS. DR. ISMAIL FAUZI BIN ISNIN

GROUP 3 Fourever

Student Name	Matric No.
TAN YI YA	A23CS0187

My Contribution to the Group and Project Work

As a team member, my responsibilities revolved around the planning and arrangement of the workspace, as well as setting up the networking infrastructure.

In task 1, I first planned for the size and position of the rooms with the aim of maximizing their convenience, then drew the layout of the floor plan as a starting point with the suggestions and comments of the other members. The drawing of the floor plan was done on CoralDraw and Visual Paradigm Online platform.

In task 2, I participated in the development of the project's preliminary analysis on current and future requirements and devices to be used by drafting questions 4 and 6 and I wrote about the feasibility study.

During task 3, I did research, comparisons on different and finally determined on the wireless access points and patch panels to use in our building.

During task 4, I designed the placement of each LAN device with the other members and allocated them in a suitable place. I also drew the wiring connecting each device to the Internet.

In task 5, I did the IP assignment to Hybrid Classroom so that the connection and the networks meet the standards.

In the final task 6a, I was responsible for the conclusions and other related fields.

Other Members' Contributions to the Group and Project Work

1. Goe Jie Ying:

She would often give her opinions and actively ask questions in a discussion, and is too enthused over the formatting of reports. She would volunteer herself to check every indentation and font size before we submit the report. She allocated all the labs on the same floor and contributed to questions 5-7. Jie Ying is the one responsible for choosing the switches and cables, the network arrangement map, and IP assignments for the Cisco Network Lab, Embedded Lab, and Technical Office.

2. Lam Yoke Yu:

She was the one explaining the tasks to all of us most of the time, and is very attentive over small details. She would often check our part and found that we had problems so we could change. She is responsible for forming the questions to 8-10, and choosing the firewall for the building. Yoke Yu contributed to a lot of calculations including calculating the number of devices, budgets, the Ethernet cables and IPs in respect of the General Purpose Lab.

3. Teh Ru Qian:

Ru Qian is often the first to start doing her work and she has amazing efficiency. She concentrated on the design of the room interiors of the ground floor and prepared questions 1-3. Ru Qian selected the building's router, laid out LAN devices and cables for the ground floor, and established IP addresses for the meeting rooms and student lounge.

How We Worked as a Group

We put our heads together and were able to share the workload. It was necessary, therefore, to share out the work according to the competencies and interests of each group member. Meetings at frequent

intervals, as well as discussions, facilitated our being on course with the project targets and timeframes. Two factors were motivating: we provided emotional support and encouragement to each other at supplied times and shared our ideas without restraint. It was instrumental in learning from our mistakes through productive comments.

What I Learned from Working as a Group

I learned about the importance of communication among team members as the coordination of activities and way of cooperation cannot work effectively without good and regular communication among all participants. We should also be aware of the due date and plan the task ahead.

What I Learned from Doing the Project

I learned about network design, that is development of a network structure instead of only knowing how to connect to wifi with my phone, I now know that we have to buy different devices to deploy a network over the building, as well as subnetting and the IP assignment.

Network Design: Developing the underlying structure plan, functioning selecting, and configuring the IP addresses for the efficient network.

Reflections and Improvements

In my opinion, the project is quite a success after concluding every task, the networking devices, LAN devices, everything is starting to come together. However, I am quite aware of some issues while progressing through the project. Firstly, the contents of each task are limited by the boundary of our current knowledge, as we cannot imagine the things we haven't learned. This has caused us the problem of applying changes to the previous tasks after learning that it was wrong or not suitable. For example, the number of networking devices deployed written in task 4 is different from what we had thought initially in task 2. Nevertheless, the process of realisation of our own weakness has taught us numerous lessons that we won't forget.

For future projects, it is possible to have improvements by thoroughly planning all the tasks beforehand with a timeline, for example by using gantt chart. We should also look through the whole project description, understand the requirements and achievables of the project before we start the project. We should also crosscheck the work with the works of the other members to maintain the integrity and correctness of all information specified.
