

Proposal: UOB TMRW MY

Category: Bank

Sub-category: UOB TMRW MY (Digital Banking Application)

Introduction

UOB TMRW is an award-winning digital bank in Southeast Asia targeted at millennials and Generation Z in Malaysia by offering simple, on-the-go banking solutions. The application currently provides smart insights based on past spending history. However, new solutions are required that go beyond historical analytics to include predictive and preventative features. This proposal outlines the integration of Financial Spending Foresight within the UOB TMRW application to maximize customer saving potential.

Problems

Young professionals, fresh graduates, and new families in Malaysia face the problem of unpredictable monthly cash flow. Recurring bills and unexpected expenses often lead to financial shortages near the end of the month or missed opportunities for optimal savings deposits. The core issue is the lack of a reliable short-term cash flow prediction model within the app that considers both future known and likely transactions. Customers need a seamless, actionable system that goes beyond simple budget alerts to actively manage their account balance over the next 30 days, minimizing stress and preventing costly fees or penalties associated with low balances.

Solutions

We propose developing the Financial Foresight Engine (FFE), a predictive feature that leverages machine learning to forecast account balances 30 days ahead. The FFE visualizes upcoming expenses, recurring payments, and income, alerting users when balances are likely to fall below a safe level. When the forecast shows excess funds, the system will suggest a “Smart Sweep” to automatically move the surplus into a savings or investment account. In the event of potential shortfalls, the app will notify users and offer practical options such as postponing payments, transferring funds, or displaying the estimated shortfall amount. This approach makes cash flow management simple, proactive and stress-free.

Justification

The Financial Foresight Engine enhances engagement and trust among users by delivering daily value through predictive assistance. Increased app usage and stronger customer loyalty will directly lead to higher adoption of UOB’s savings and investment products. Smart Sweeps and short-term credit options can generate steady non-interest income, while improved customer retention will help reduce churn. This innovation is cost-efficient to implement using UOB’s existing data infrastructure and has strong potential to deliver measurable returns through product cross-selling and enhanced digital engagement.

Conclusion

In conclusion, the Financial Foresight Engine is a strategic and feasible step toward making UOB TMRW MY a more intelligent, proactive, and trusted financial partner. It transforms the app from a transactional tool into a daily financial assistant that predicts, advises, and empowers users to save smarter and spend with confidence.
