SECP3106 APPLICATION DEVELOPMENT

SECTION 2

Lab 1: Daily Activity Recorder

LECTURER: Dr. Seah Choon Sen

Student Name	Matric No.
TAN YI YA	A23CS0187

Objective

- To revise the basic concepts learned in Lesson 1, Lesson 2, and Lesson 3 in Flutter development.
- To practice working with the Flutter project structure.
- To implement widgets correctly.
- To manage application state using the `setState()` method.
- To utilise Text input using `TextField`
- To learn displaying data in a list

Brief description of the system

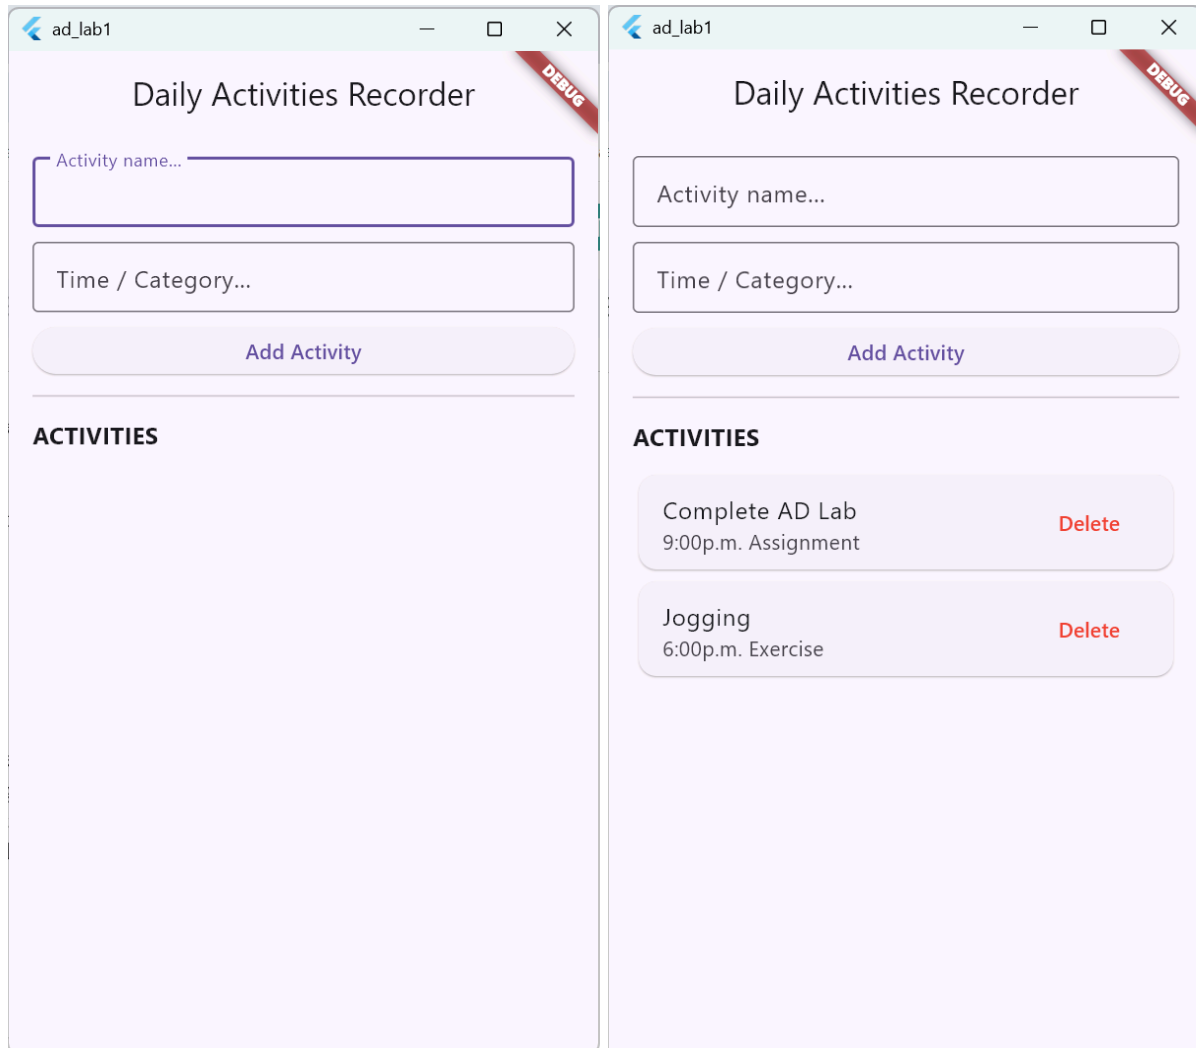

The Daily Activities Recorder App is a simple Flutter application designed to record and manage daily tasks. It allows users to enter an activity name along with a specific time or category. The system stores these entries in a local list and displays them on the screen, providing a straightforward way for users to track their routine. Additionally, the app includes functionality to delete activities from the list once they are completed or no longer needed.

Explanation of the interface

The interface is designed to be clean and user-friendly, consisting of the following main components:

- **AppBar:** displays the title "Daily Activities Recorder" to identify the application.
- **Activity name:** `TextField` input field where users type the description of their task.
- **Time/Category:** `TextField` input field used to specify when the activity occurs or how it is classified.
- **Add Activity button:** triggers the saving process, taking the text from both input fields and adding it to the display list using `setState()`.
- **Activity list:** `ListView` that dynamically displays all recorded entries in a vertical format.
- **Delete button:** located next to each specific activity entry, allowing the user to remove that individual item from the list.

Screenshots of the app

Conclusion

The implementation of a basic Flutter application using stateful widgets is successfully demonstrated. By integrating user input through text fields and managing the application state with `setState()`, the app provides a functional interface for recording and deleting daily activities. This foundational project reinforces the core concepts of Flutter development including project structure, widget usage, and basic data flow.
