Simple program to familiarize with Program Code, Rebuild & Start Without Debugging

Execute the programs below:

PART 1:

i. Part A: Adding and Subtracting Integers

```
TITLE Add and Subtract (AddSub.asm)

; This program adds and subtracts 32-bit integers
; Authors:
; Date:

TOTAL dword 0 ; a variable named TOTAL (declared as DWORD)

.code

main PROC

    mov eax, 123400h ; Set EAX with the value of 123400h
    add eax, 567800h ; Add the content of EAX with 567800h
    sub eax, 77700h ; Subtract content of EAX with 77700h
    mov TOTAL, eax ; Store content of EAX to TOTAL

    call DumpRegs

    exit
main ENDP

Detail Debugging Process

PART 2:

Run Debugging Process for Part B, Part C and Capture Video

1. Press F10 for step by step debugging.

3. Open 5 windows:

- Watch
- Autos
- Memory
- Registers
- Disassembly

4. Default memory data segment value is at first variable: &val1 or 0x00405000 (depend on memory used).

5. Add variables val1, val2, val3 and finalval to Watch

Watch 1		
Name	Value	Type
val1	0x00010000	unsigned long
val2	0x00040000	unsigned long
val3	0x00020000	unsigned long
finalVal	0x00000000	unsigned long

6. F10 to trace/step the assembly program line by line.

7. Please debug by looking at value changes at Watch, Memory, Autos and Registers windows.

8. Disassembly window can show the following optional information:

- Memory address where each instruction is located. For native applications, it is the actual memory address. For Visual Basic or C#, it's an offset from the beginning of the function.
- Source code from which the assembly code derives.
- Code bytes, that is, the byte representations of the actual machine or MSIL instructions.
- Symbol names for the memory addresses.
- Line numbers corresponding to the source code.

What is Byte Code (or Machine Code) for the following assembly instructions:

```

mov ax, valw1 ; start with 10000h
add ax, valw2 ; add 40000h
sub ax, valw3 ; subtract 20000h
mov finalValw, ax ; store the result (30000h)

```

Byte Code:

```

mov ax, valw1; start with 1000h
004C3660 66 A1 00 60 4C 00    mov     ax,word ptr [valw1 (04C6000h)]
add ax, valw2; add 4000h
004C3666 66 03 05 02 60 4C 00    add     ax,word ptr [valw2 (04C6002h)]
sub ax, valw3; subtract 2000h
004C366D 66 2B 05 04 60 4C 00    sub     ax,word ptr [valw3 (04C6004h)]
mov finalValw, ax; store the result(3000h)
004C3674 66 A3 06 60 4C 00    mov     word ptr [finalValw (04C6006h)],ax

```
